**SPECIAL SCIENTIFIC REPORT-FISHERIES No. 292**

**UNITED STATES DEPARTMENT OF THE INTERIOR  
FISH AND WILDLIFE SERVICE**

#### SPECIAL NOTE

The International North Pacific Fisheries Commission, established in 1953 by the International Convention for the High Seas Fisheries of the North Pacific Ocean, coordinates the research of the member nations: Japan, Canada, and the United States. The resulting investigations provide data to the Commission for use in carrying out its duties in connection with fishery conservation problems in the North Pacific Ocean. Publication of this scientific report has been approved by the United States Section of the Commission.

# NORTH PACIFIC AND BERING SEA OCEANOGRAPHY, 1957

by

Felix Favorite and Glenn M. Pedersen  
U. S. Fish and Wildlife Service  
Seattle, Washington

## ABSTRACT

This report presents oceanographic data collected at fishing stations in the North Pacific and the Bering Sea from May to September 1957, as a part of the research conducted by the United States Fish and Wildlife Service under the direction of the United States Section of the International North Pacific Fisheries Commission.

The report also describes procedures and shows stations occupied by the fishing vessels Attu, Pioneer, and Paragon. The tabulated data show temperature, and values of salinity, density, dissolved oxygen, and dissolved inorganic phosphate at varying depths to 1100 meters; number, time, and position of drift bottle releases; time, position, and weather and sea conditions for bathythermograph lowerings; and displacement volumes and numbers of organisms per cubic meter of water for the vertical plankton hauls.

## COLLECTION OF DATA

### Vessels and Observers

Three halibut schooners, the M/Vs Attu, Pioneer, and Paragon, chartered by the Pacific Salmon Investigations to determine the distribution and migration of salmon in the North Pacific and the Bering Sea, collected oceanographic data in conjunction with exploratory fishing. The specifications of this type of vessel have been presented by Powell and Peterson in Experimental Fishing to Determine Distribution of Salmon in the North Pacific Ocean, 1955, Special Scientific Report--Fisheries No. 205, Washington, D. C., July 1957. The vessels were equipped with portable hydrographic winches and davits to facilitate handling the oceanographic equipment: Nansen bottles, bathythermographs, and plankton nets.

The vessels, periods of operation, and oceanographic observers are as follows:

<u>Attu</u>	29 May - 8 Sept.	Glenn M. Pedersen
<u>Pioneer</u>	2 June - 11 Sept.	John W. Schantz
<u>Paragon</u>	27 July - 12 Sept.	Alan H. Haselwood

### Oceanographic Stations

The vessels, following a predetermined plan for fishing, observed primary oceanographic stations at fishing locations, at secondary stations between the fishing locations, and at other positions designed to supplement primary-station data. Stations occupied by the three vessels are shown in figure 1, and the observations are summarized in tables 1, 2, and 3 (pages 4, 5, and 6).

## PROCEDURE

### Primary Stations

At primary stations, the observations included hydrographic casts to the bottom or to a maximum of 1100 meters, a 900-foot BT, and a horizontal tow and vertical hauls for plankton.

When the conditions of observation were relatively ideal, the itinerary of the vessel was adjusted to arrive on station in time to set the gill nets between 1600 and 1800. A set at this time normally allowed the oceanographic observer time to complete the routine between 2200 and 2400.

Prior to the setting of the nets the routine began with a 20-minute surface plankton haul on a circular course. Then the gill nets were set and the remainder of the oceanographic routine was accomplished while the vessel was moored to the downwind end of the net.

The deep cast required an hour or more, depending on the adversity of the weather and sea conditions. When the biologist was able to assist with the vertical plankton hauls, these were made between hydrographic casts after taking and analyzing the 900-foot BT trace. Without this assistance the plankton hauls were made after the shallow cast. Thus the plankton hauls, shallow cast, and BT trace were usually made within an hour of each other.

### Secondary Stations

Secondary stations, taken between fishing stations without interrupting the cruise plan, consisted of a 900-foot BT and one shallow cast to 125, 150, or 170 meters. These stations were taken at the 1000-fathom curve on north-south transits through the Aleutian Passages, and at various locations on the return voyages when weather permitted.

### Hydrographic Casts

The observers made two casts of seven Nansen bottles at primary stations. Early spacing was 10, 20, 30, 50, 80, 110, and 140 meters for the shallow cast and 170, 200, 250, 300, 500, 800, and 1100 for the deep cast. These were later changed to 10, 20, 30, 50, 75, 100, 125, and 150, 175, 200, 300, 500, 800, 1100 meters in order to obtain more data in the upper 200 meters of the water column.

Each Nansen bottle had two protected reversing thermometers. Three or four bottles in each cast had an unprotected thermometer, usually in positions 1, 5, 7 or 1, 4, 5, 7.

### Water Samples

On each station and at every BT lowering, the observers dipped surface samples by bucket. They drew samples for analysis of dissolved oxygen and phosphate from four alternate depths in each cast, and for chlorinity from all depths; they collected some

phosphate samples also from the surface.

### Bathymograph Lowerings

Using 900-foot BT's almost exclusively, the observers obtained traces at every hydrographic station and at intervals of 20-30 miles enroute between stations, collecting a total of 669 traces. The vessels stopped for each lowering.

### Plankton

Plankton samples were taken from both horizontal tows and vertical hauls with 1/2-meter nets of #6 mesh.

The horizontal tow was made at the surface at a speed of about 3 knots for a period of 20 minutes. The data from these tows are not presented because early in the cruises considerable amounts of phytoplankton were obtained that prevent any quantitative analysis of zooplankton, and the tows were discontinued because of repeated damage to the nets. Visual examination of the samples obtained indicate no significant qualitative difference from the upper vertical haul.

Three vertical hauls were made to determine vertical distribution of plankton. Hauls from 300 meters to the surface, from 300 meter to the bottom of the thermocline, and from the thermocline to the surface, were made at a velocity of approximately 50 meters per minute. However, individual interpretations of the BT traces do not rigorously define the bottom of the thermocline, and station data should be used to determine the relative position in the thermocline at which the latter two hauls were commenced or terminated.

### Nightlight Observations

Because of generally unsatisfactory weather and sea conditions, only a few nightlight samples were collected. They have not been tabulated.

### Drift Bottles

A total of 473 drift bottles were released individually in groups of 24 or 48 at various locations which are presented in table 4 (page 106). Figure 2 shows a sample bottle. Each group of 24 had a single serial number.

## ACKNOWLEDGMENTS

The authors wish to acknowledge the assistance of Dr. Richard H. Fleming and members of the Department of Oceanography of the University of Washington in establishing the Oceanographic Section of the Pacific Salmon Investigations, and in equipping the charter vessels for the oceanographic work.

We are indebted to Ralph W. Riley for assisting in the chemical analyses and Phillip Seelinger for the plankton analyses.

Acknowledgment is made to the Fisheries Research Biologists and crew members aboard the respective vessels for their assistance to the field personnel, and to the members of our staff that participated

in the processing and presentation of these data.

## SUMMARIES OF OBSERVATIONS

Sta.	Hydrographic station
Set	Gill-net-set numbers at this position
GCT	Median hour between messenger times, in GCT (For median hour of plankton hauls, see Plankton Data)
Date	Date of hydrographic cast
D	Interpolated depth in meters (Extrapolated depths enclosed in parentheses)
BT	Bathythermograph lowering
T	Temperatures
Cl	Chlorinity samples
O	Dissolved oxygen samples
P	PO <sub>4</sub> -P samples
P1	Plankton samples
1	Horizontal haul
2	300 m. to thermocline
3	thermocline to surface
4	300 m. to surface
5	1, 2, 3, 4

Figure 2.--U. S. Fish and Wildlife Service drift bottle.

## TABULATED DATA

### Explanation of Data Headings and Methods Used

#### Station Data

##### Observed Data

Station No.: The chronological order in which the stations were taken. Equivalent gill net sets are listed in Table 2.

Lat., Long.: In all cases determined by loran readings and in some cases supplemented by celestial sights.

Time: The Time (GCT) at which the messenger was released. The second time indicates messenger time of second cast or, in case of more than two casts, the time of the final cast.

Weather, Clouds, Sea, Swell: Coded values as presented in HO 606-C, Bathythermograph Observations.

Wet and Dry Bulbs: Readings from hygrometer.

Depth (m): Depths of bottles in shallow cast determined by wire angle. In the deep cast, the difference between the thermometric depths (Z) and the meter wheel readings (L) were plotted against the meter wheel readings (L). From the smoothed curve, values of L-Z were subtracted from the wire length for each bottle depth to obtain the observed depth. Parentheses indicate the approximate depth of a bottle without an unprotected thermometer, on a cast that post-tripped.

- T ( $^{\circ}\text{C}$ ): Temperatures observed from reversing thermometers read to  $0.01^{\circ}\text{C}$ . Surface temperatures from bucket samples are reported to  $0.1^{\circ}\text{C}$ . Temperatures at depth reported to  $0.1^{\circ}\text{C}$  were read from the BT trace.
- S ( $^{\circ}/\infty$ ): Salinity as defined from chlorinity. Chlorinity determined by Knudsen's method using double titration except that samples from the Paragon were checked only periodically.
- $\text{O}_2$  ( $\mu\text{g}/\text{L}$ ): Dissolved oxygen content expressed as milligram-atoms per liter to two decimal places. These samples were fixed on board and shipped to Seattle for analysis by the Winkler method.
- $\text{PO}_4 - \text{P}$  ( $\mu\text{g}/\text{L}$ ): Dissolved inorganic phosphate expressed in microgram-atoms per liter to the nearest 0.1 of a unit. Determined on board within two hours of sampling by Deniges-Atkins method using Nessler tubes. Standard comparison solutions of 0.3, 0.6, 0.9, 1.2, 1.5, 1.8, 2.1, 2.4, 2.7, 3.0, 3.3 and 3.6  $\mu\text{g}/\text{L}$  were used. Values of samples not compared within two hours were discarded.

## Interpolated Data at Standard Depths

All interpolated values were taken from smoothed curves drawn from observed data which were supplemented by BT data and in some instances by comparison with adjoining or previous stations. Parentheses indicate extrapolated values.

Depth (m): Standard depth in meters.

T (°C): Interpolated values at standard depths.

S (°/00): Interpolated values at standard depths.

## Computed Data at Standard Depths

Calculations were done on an IBM 650, Magnetic Drum Data-Processing Machine, at the computer center of the University of Washington, using formulas presented in Oceanographic Data Processing by Automatic Methods, U. S. Hydrographic Office, 31 January 1955.

$\sigma_T$ : Density, defined by  $(\text{specific gravity} - 1) \times 1000$ , expressed as grams per liter.

$\Delta D$ : Anomaly of dynamic height, in dynamic meters, of the sea surface relative to the indicated depth in meters.

## Bathythermograph Data

Wind            Direction reported to nearest ten degrees  
                 (Final cipher omitted)  
                 Force estimated in knots

Air Temp.    Wet and dry bulb readings from hygrometer

(Following coded values taken from HO 606-C, Bathythermograph Observations)

### Weather

00-49    No precipitation at the ship at the time of observation

00-19    No precipitation, fog, dust storm, sandstorm or drifting snow at the ship at the time of observation or during the preceding hour except for 09.

00       Cloud development not observed or not observable.

01       Clouds generally dissolving or becoming less developed.

02       State of sky on the whole unchanged.

03       Clouds generally forming or developing.

10       Light fog (visibility 1100 yards or more).

11       Patches of fog.

18       Squalls

20-29    Precipitation, fog or thunderstorm at the ship during the preceding hour but not at the time of observation.

20       Drizzle, not freezing.

21       Rain, not freezing.

40-49    Fog at the time of observation

40       Fog at a distance at the time of observation, but not at the ship during the last hour, the fog extending to a level above that of the observer.

41       Fog in patches.

42       Fog, sky discernible        (Has become thinner

43       Fog, sky not discernible ) during preceding hour

44       Fog, sky discernible        ( No appreciable change

45       Fog, sky not discernible    ) during preceding hour

46       Fog, sky discernible    ( Has begun or has become thicker

47       Fog, sky discernible    ) during preceding hour

48       Fog, depositing rime, sky discernible

49       Fog, depositing rime, sky not discernible

50-99    Precipitation at the ship at the time of observation

50-59    Drizzle at time of observation

50       Drizzle, not freezing, intermittent ( Slight at time of

51       Drizzle, not freezing, continuous    ) observation

52       Drizzle, not freezing, intermittent    { Moderate at time

53       Drizzle, not freezing, continuous        } of observation

60-69	Rain at time of observation	
60	Rain, not freezing, intermittent	{ Slight at time of observation (Moderate at time of )observation

## Plankton Data

These data are presented as numbers of organisms and as numbers of copepods per cubic meter of water filtered, the efficiency of the net assumed to be 100%. The total number of copepods is presented under COPEPODA in the table of organisms.

Displacements volumes (cc): The plankton sample was filtered through a fine mesh net, dried by blotting, and placed in a graduated cylinder containing a known volume of fluid.

Numbers of organisms per cubic meter: The plankton samples were split by using a Folsom splitter described in Statistical Analysis of the Performance of the Folsom Plankton Splitter, Based on Test Observations, by G. F. McEwen, M. W. Johnson, and Th. R. Folsom, Archive fur Meteorologie Geophysik und Bioklimatologie, Series A, Meteorologie und Geophysik, Band 7, 1954. The number of splits varied from 1-7, depending on the volume of the plankton sample.

The number of organisms counted averaged approximately 400 per sample.

### Presentation of Data

DATE/HOUR	Day and median hour (GCT) of plankton hauls
t	Less than one organism per cubic meter, and not computed in the total
*	Excessive phytoplankton
( )	Sample taken from torn net
